

## ATS 2200 and 4400 Abrasive Removal Solution for Waterjet Cutting Systems

Never shut down production for tank clean outs again. The ATS 2200 and ATS 4400 abrasive removal systems are the perfect way to improve your waterjet operations.

The ATS 2200 is designed to work with the 2200 Super Sack which holds up to 2,000 lbs. of slurry while the ATS 4400 is designed to work with the 4400 Super Sack which holds up to 4,000 lbs. of slurry.

This abrasive handling solution allows you to quickly and easily remove 2,000 lbs. (ATS 2200) and 4,000 lbs. (ATS 4400) of spent abrasive sludge from your waterjet holding tank into a disposable bag.

Engineered with rigid steel construction and equipped with a Sandpiper HDF2 diaphragm pump, the ATS systems provide reliability and durability for many years of use. The pneumatic diaphragm pump runs on shop air, with no additional power needed. The unit also features a patented 6" Cross-Flow Separator design which removes sediment from the water stream before it reaches the pump increasing the removal rate and virtually eliminating maintenance costs and pump repairs. The unique abrasive removal "nozzles" allow for high rates of removal of more than one ton per hour.

The ATS systems can be used manually or make sludge removal completely hands free with an optional in-tank pipe kit and cycle timer which are sold separately.
